The spine viewed from the same location as in the top left picture but looking forward. The large panel has been removed allowing a view on various pipes and hoses. Almost all panels need to be unscrewed for maintenance with very few quick release hatches present on early jet fighters such as the Mirage.

A view of the upper spine of the aircraft. The red band marks the location of the original intake. An antenna can be seen in the rear. The nose small round panels in front of the hydraulic reservoirs.

(Previous pages, early days feature camouflage type camouflage white) losses

(Previous pages, detail of the front of the aircraft covers the front of the cockpit)

The spine structure is in the top left location as in the top left. This location has been removed allowing the panel to be removed for maintenance. Almost all for quick release hoses. Almost all for quick release with very few on early jet fighters such as the Mirage.

A view of the upper spine is shown in the top left picture. The red band marks the location of the engine. The TACAN antenna and the air intakes can be seen in the top right picture. The two small round panels in front of the hydraulic reservoirs are shown in the bottom left picture.

(Previous page) The early days featured a type camouflage with a white 'lower' section.

(Previous page) Views of detail work on the front fuselage cover late in the project.

The spine shown from the same location as in the top left picture but looking forward. The large panel has been removed allowing a view on various pipes and hoses. Almost all panels need to be unscrewed for maintenance with very few 'quick release' hatches such as the Mirage 15
